

### Information Security Policy

Security of information is vital to Smart Video & Sensing's continued success. Therefore, we have adopted an Information Security Management System following the requirements of ISO27001-2013.

We assess our security risks and have objectives for security performance against these; which are intended to drive continual improvement in security measures.

Our objectives for our security performance include:

- Access to data
- Loss of data
- Corruption or damage to data and records

Our performance against objectives is measured and reviewed and where shortfalls arise they are addressed.

We have introduced protocols and procedures to mitigate our security risks and ensure these are applied throughout the business. Although security policies and processes are established by the senior management team, it is mandatory that everyone in the business complies with all security related instructions.

Smart Video & Sensing recognises that security threats are not static; therefore, we regularly review our security performance and risks with the objective of continually improving our security against established indicators.

We comply with all legislative requirements for security of information as well as meeting industry and client requirements. It is central to our continued success as a business that we protect client and internal commercial information from loss. Not only that, we have measures in place that, if a breach happens, will minimise any adverse effects.

Security of our clients is of paramount importance to us and we maintain the trust of our clients through the implementation of our security policies and procedures.
